

Life in Melbourne as depicted by Pedestrians

Karnesh Jain

Feb, 2019

Introduction

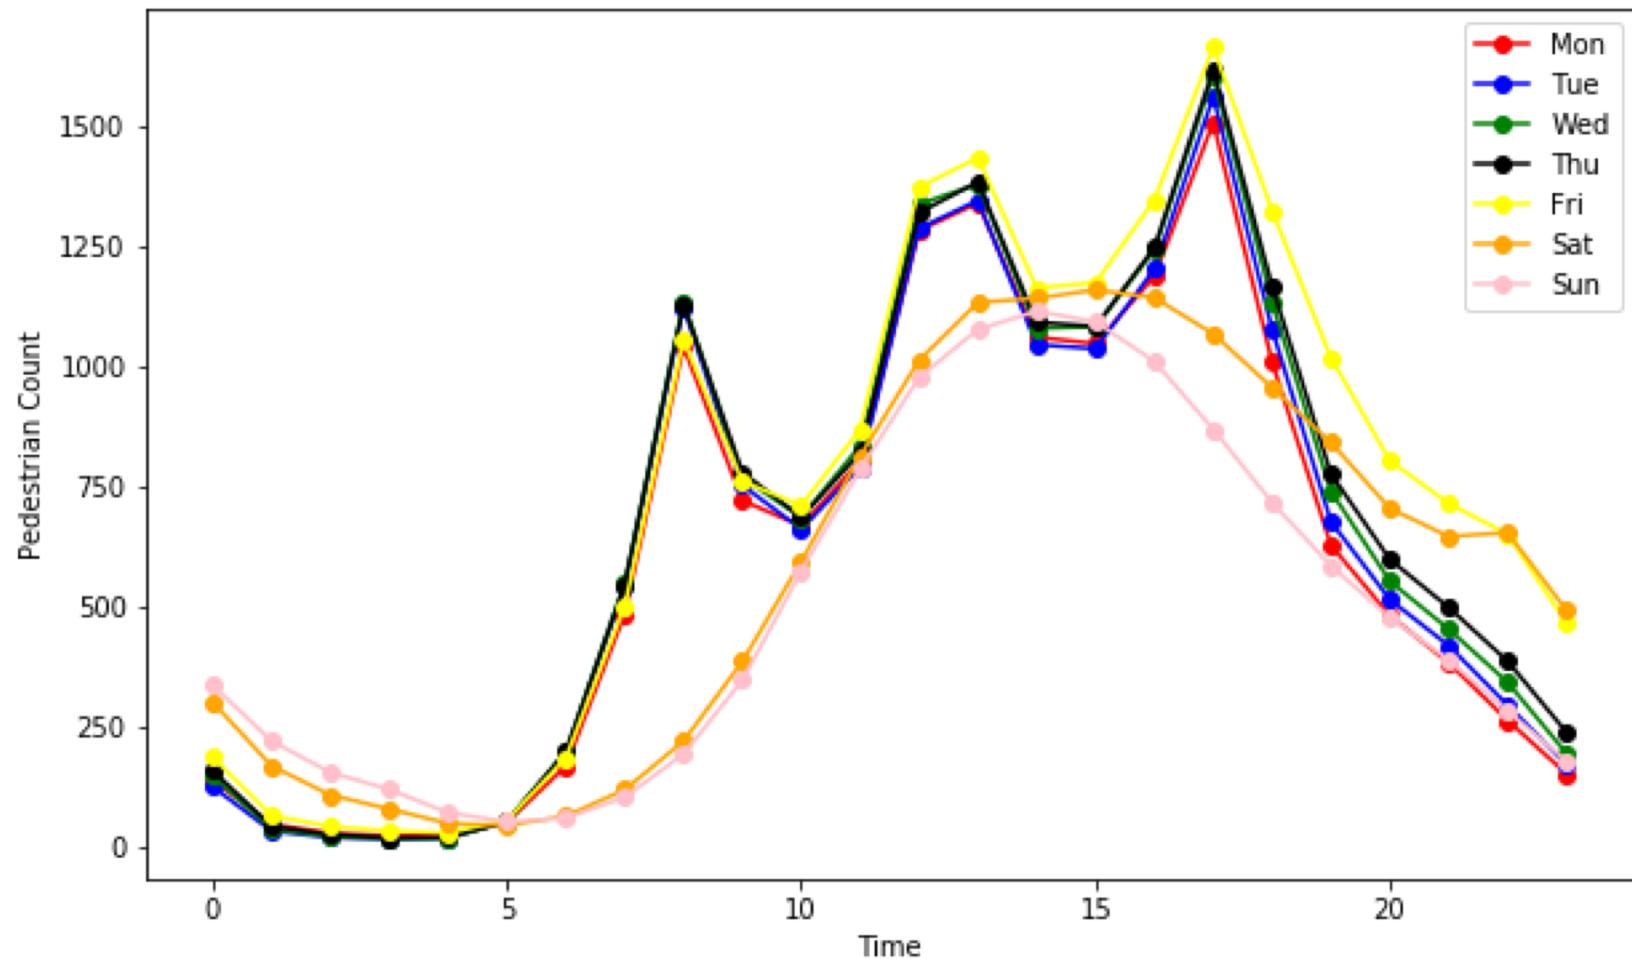

- Essential part of modern cities.
- Can help in deciding the place to open new business.
- Gives idea about the night life of people in the city.

Also, one can combine pedestrian data with other datasets to obtain useful information

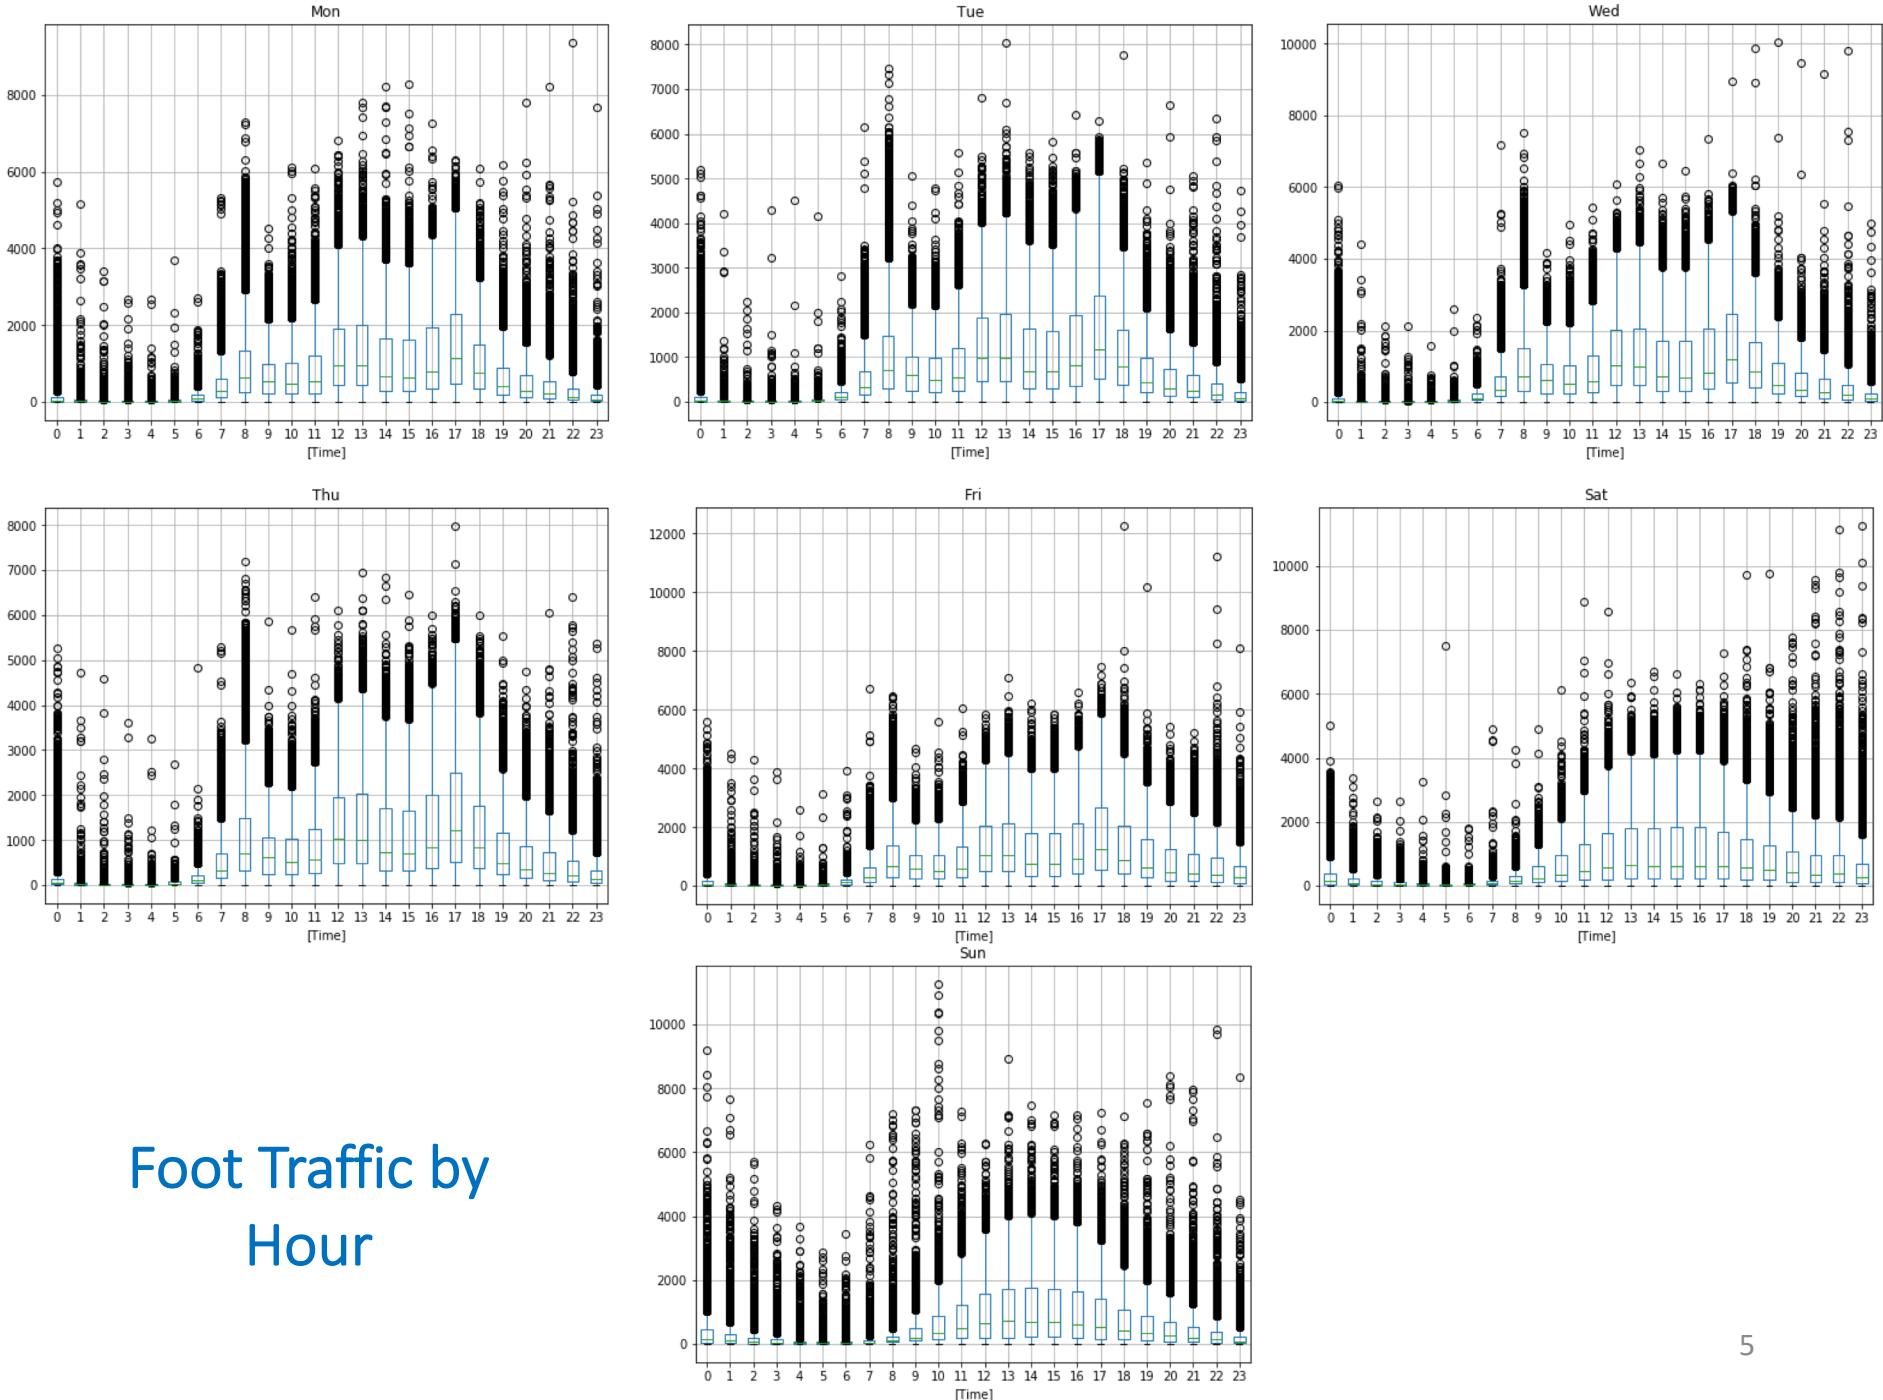

- Weather data to study whether people go out on a rainy day
- Restaurant data to investigate the number of pedestrian vs popularity of restaurants

Exploratory data analysis

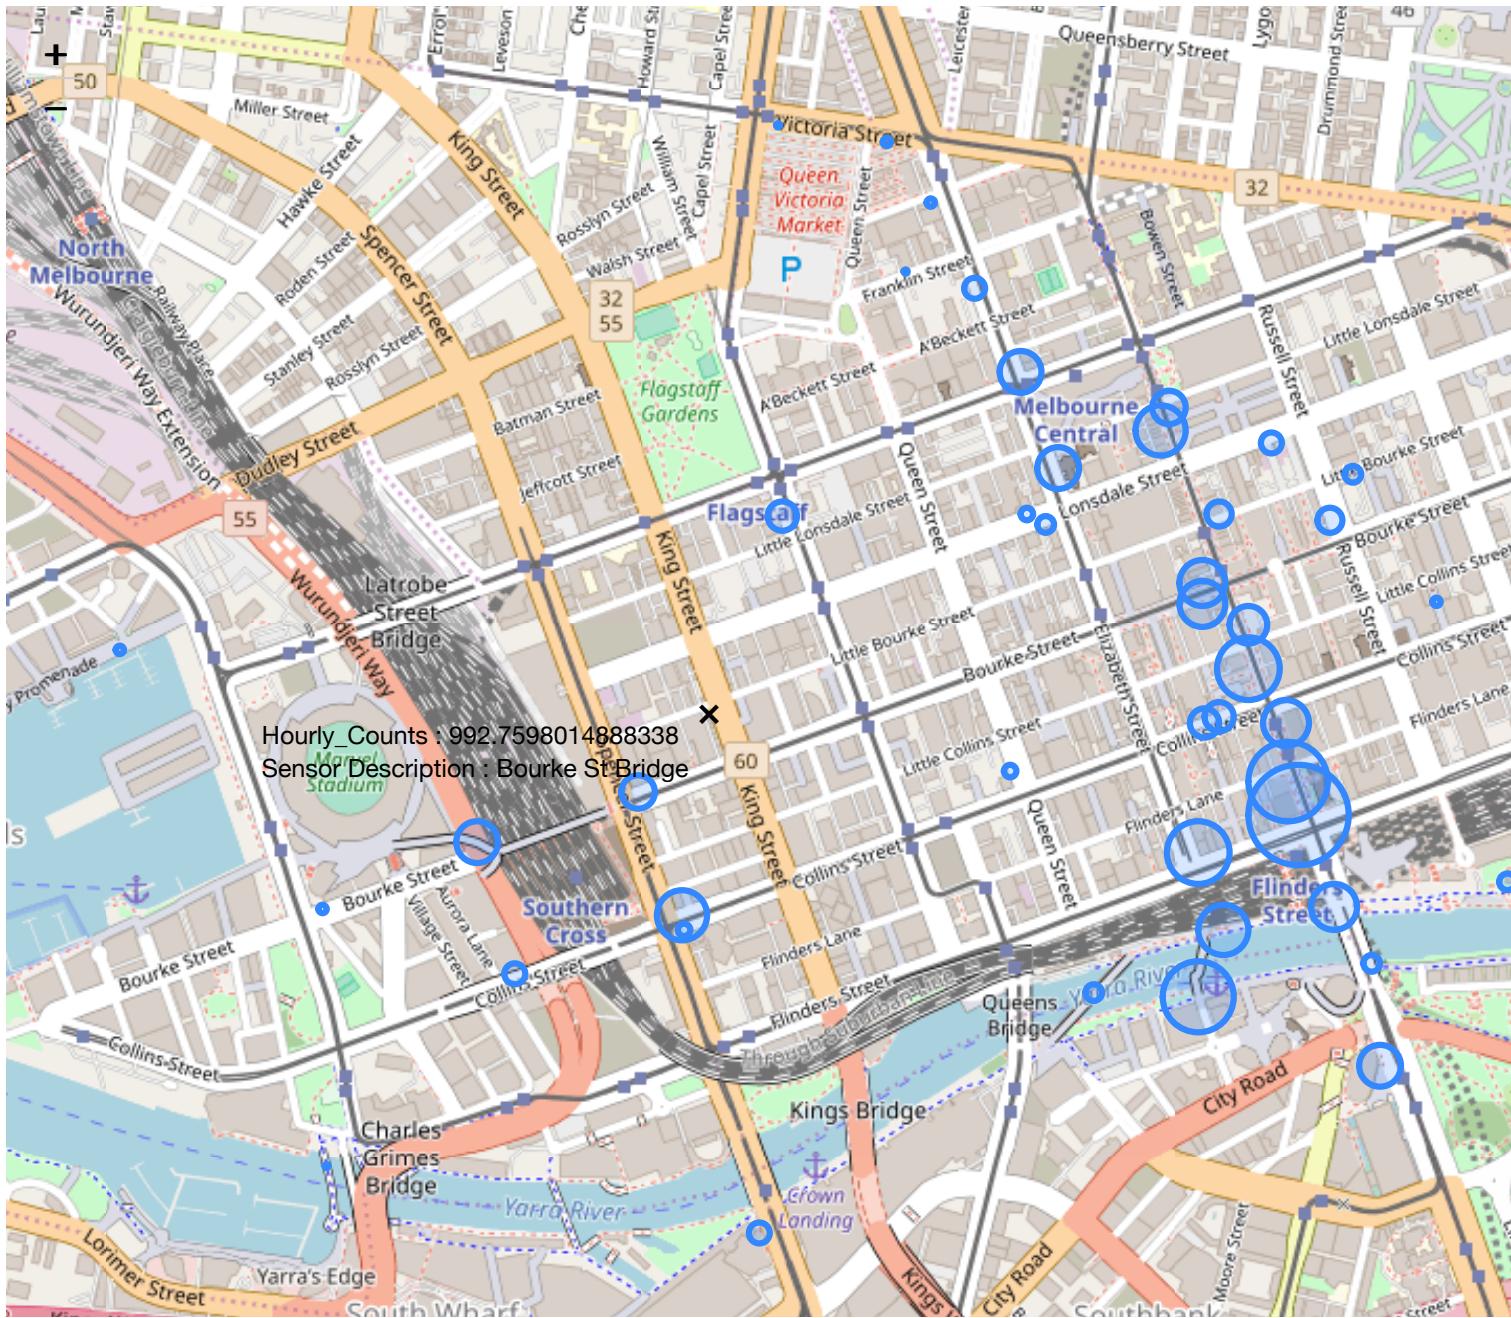

Foot Traffic trend with days of the week

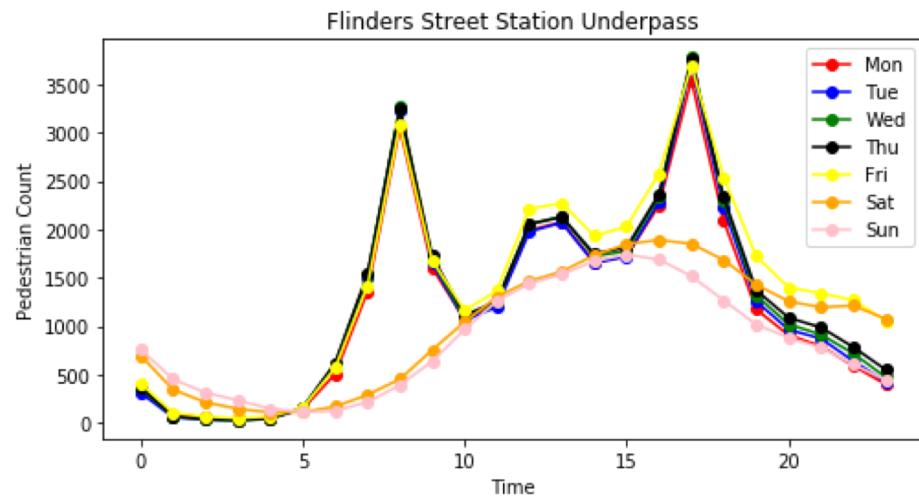

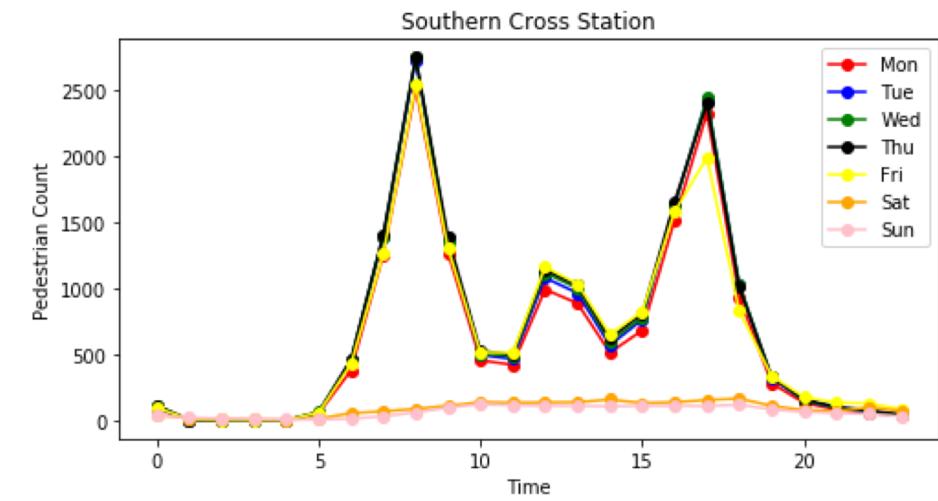

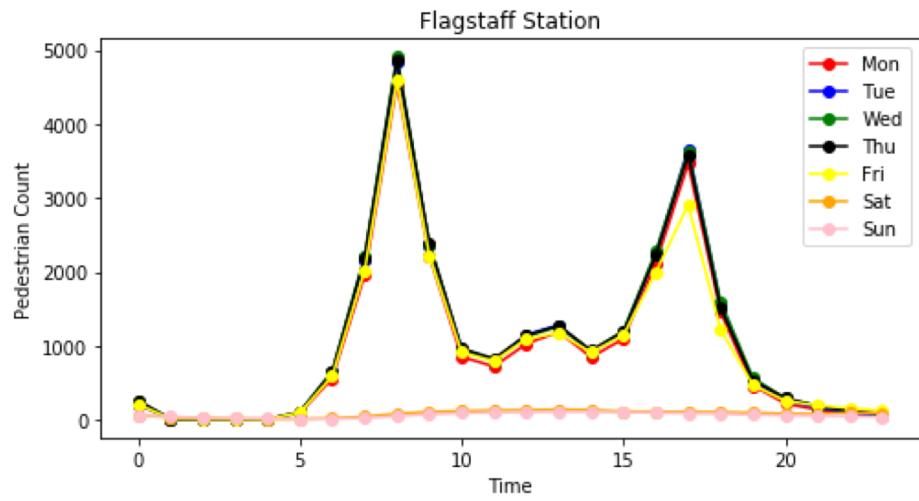

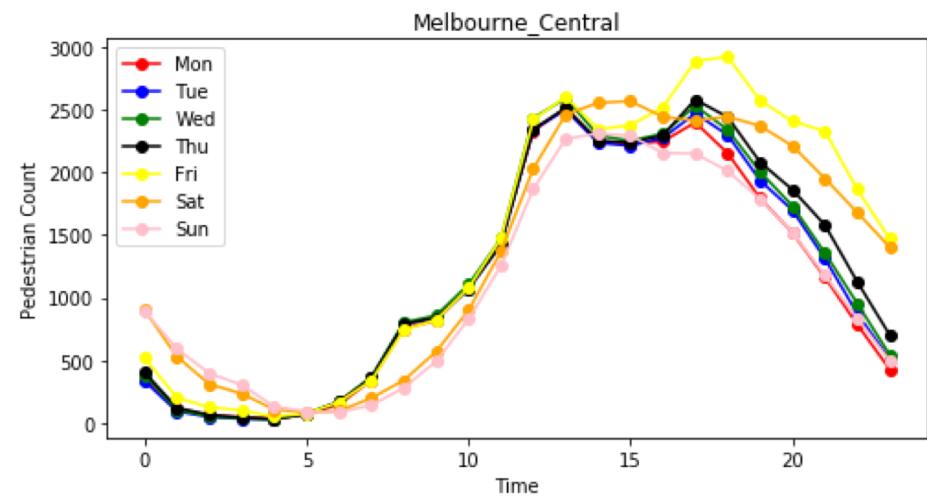

Foot Traffic by Hour

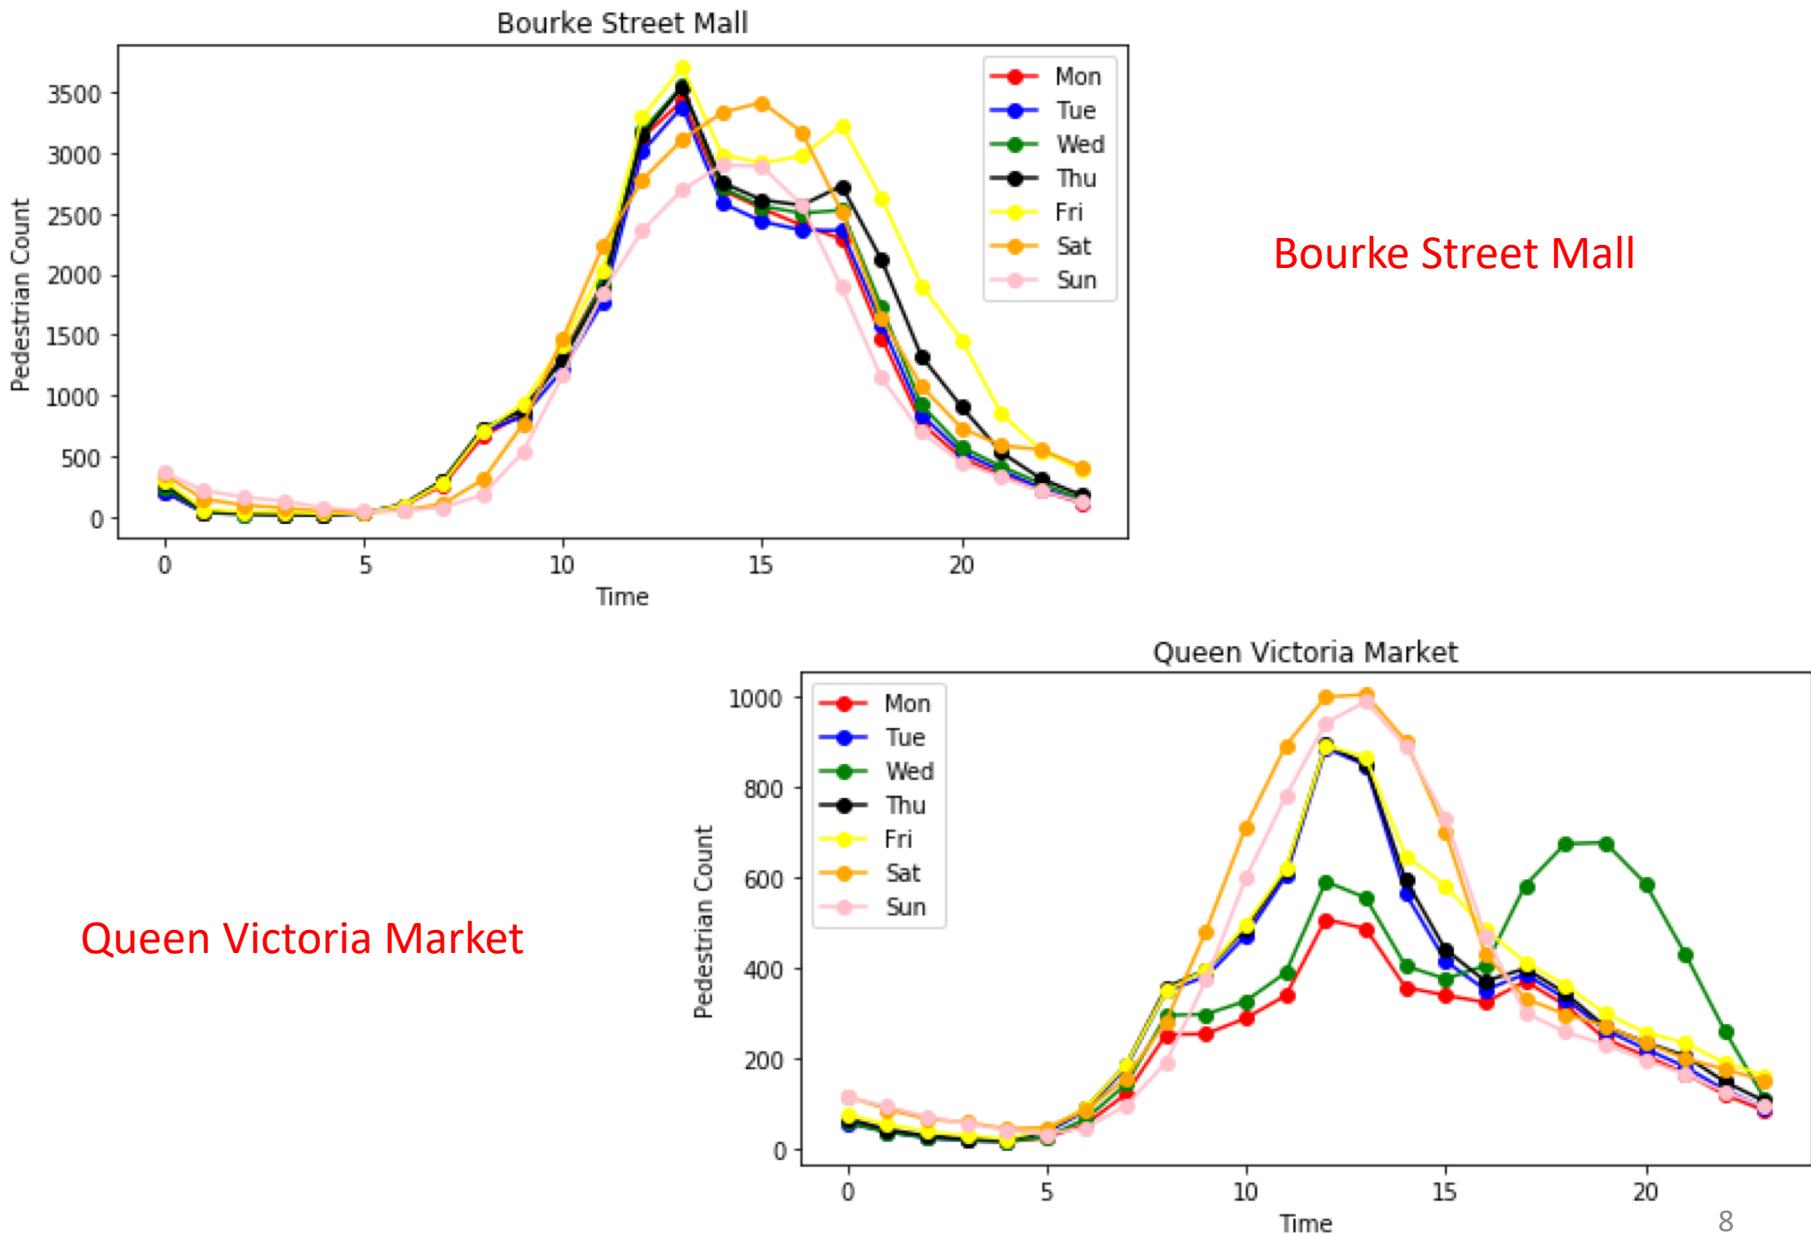

Foot Traffic at different locations in the city

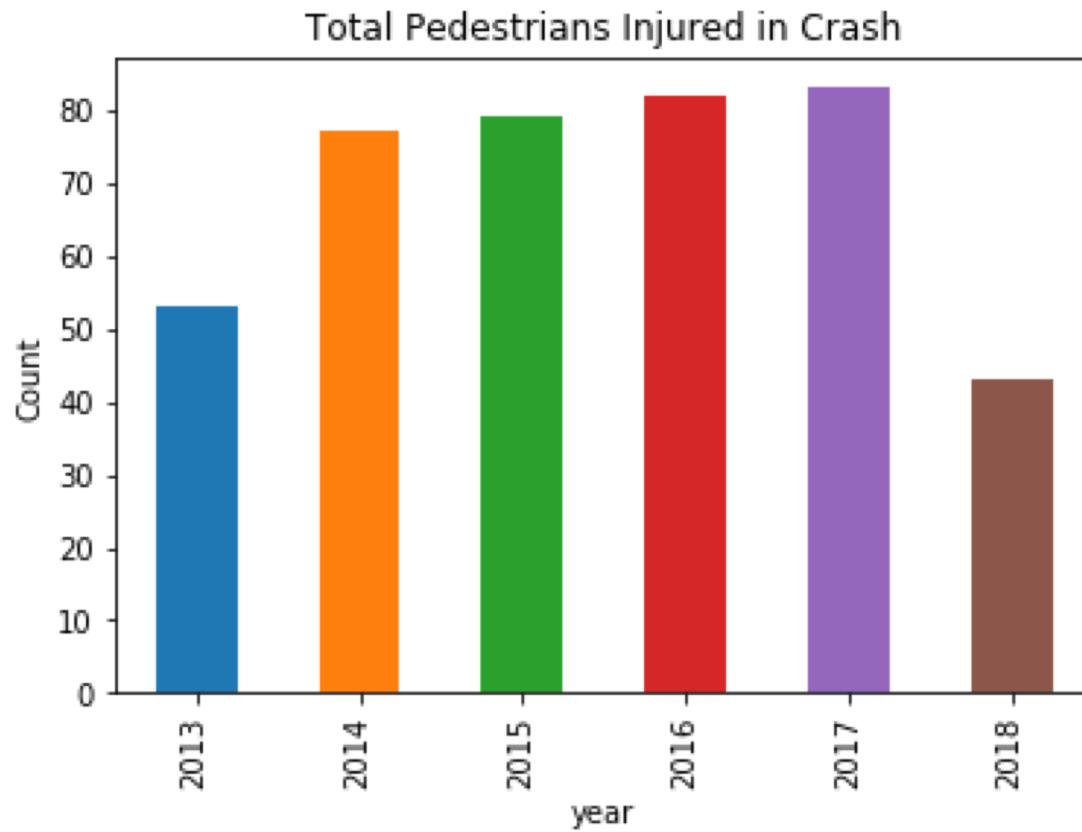

Foot Traffic at Train Stations

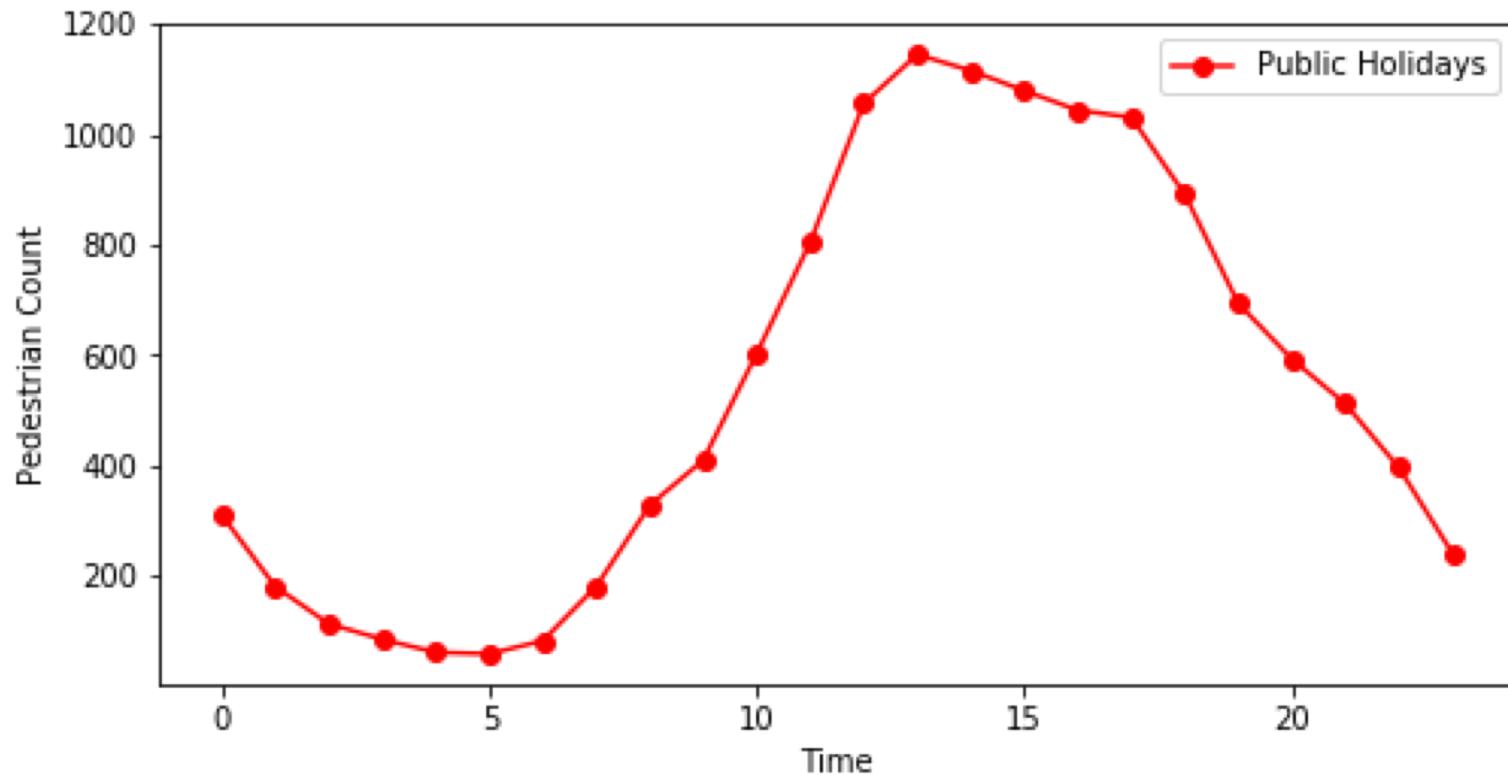

Foot Traffic at Markets

Accidents involving pedestrians

Trend on public holidays

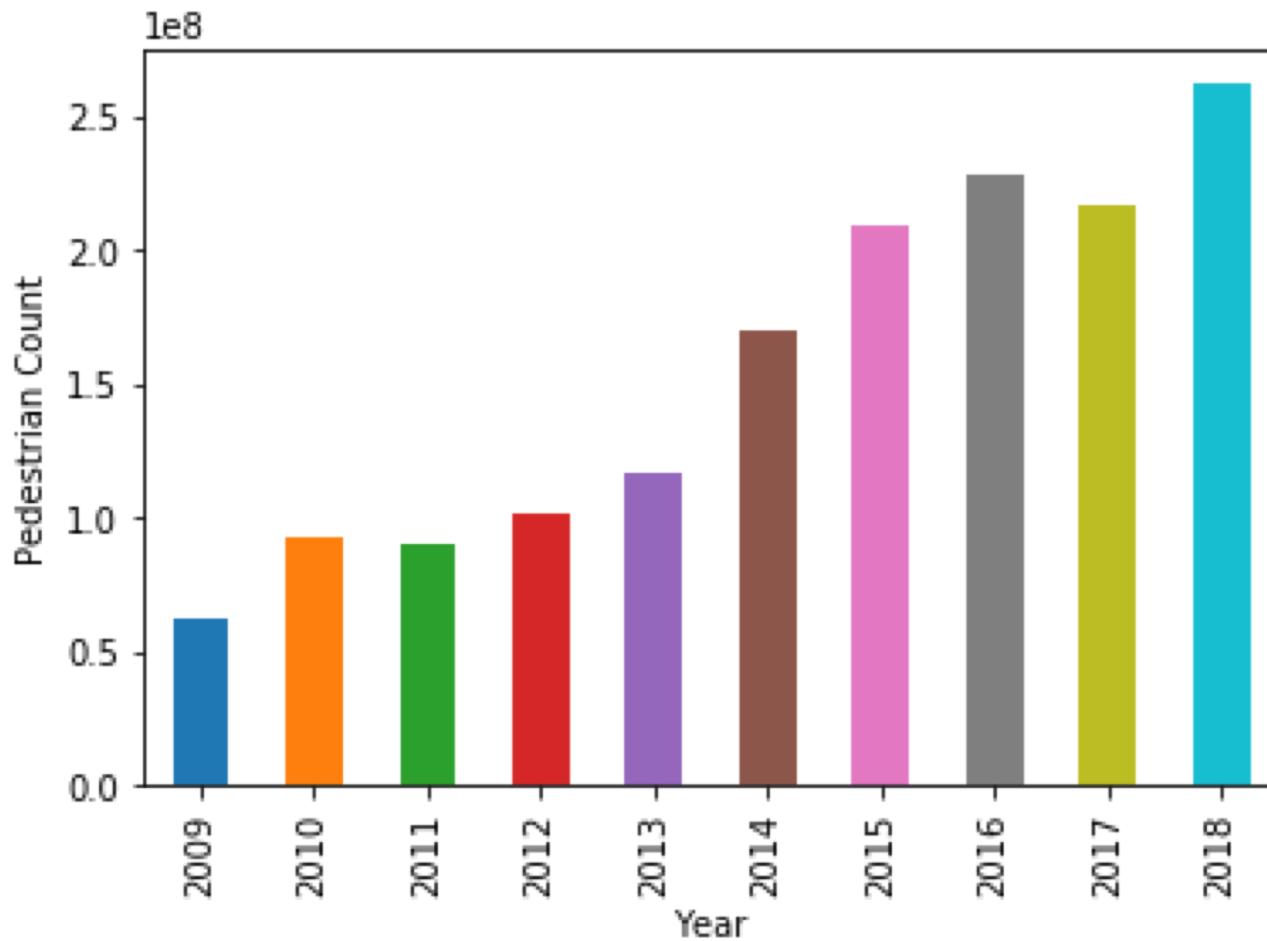

Future Directions

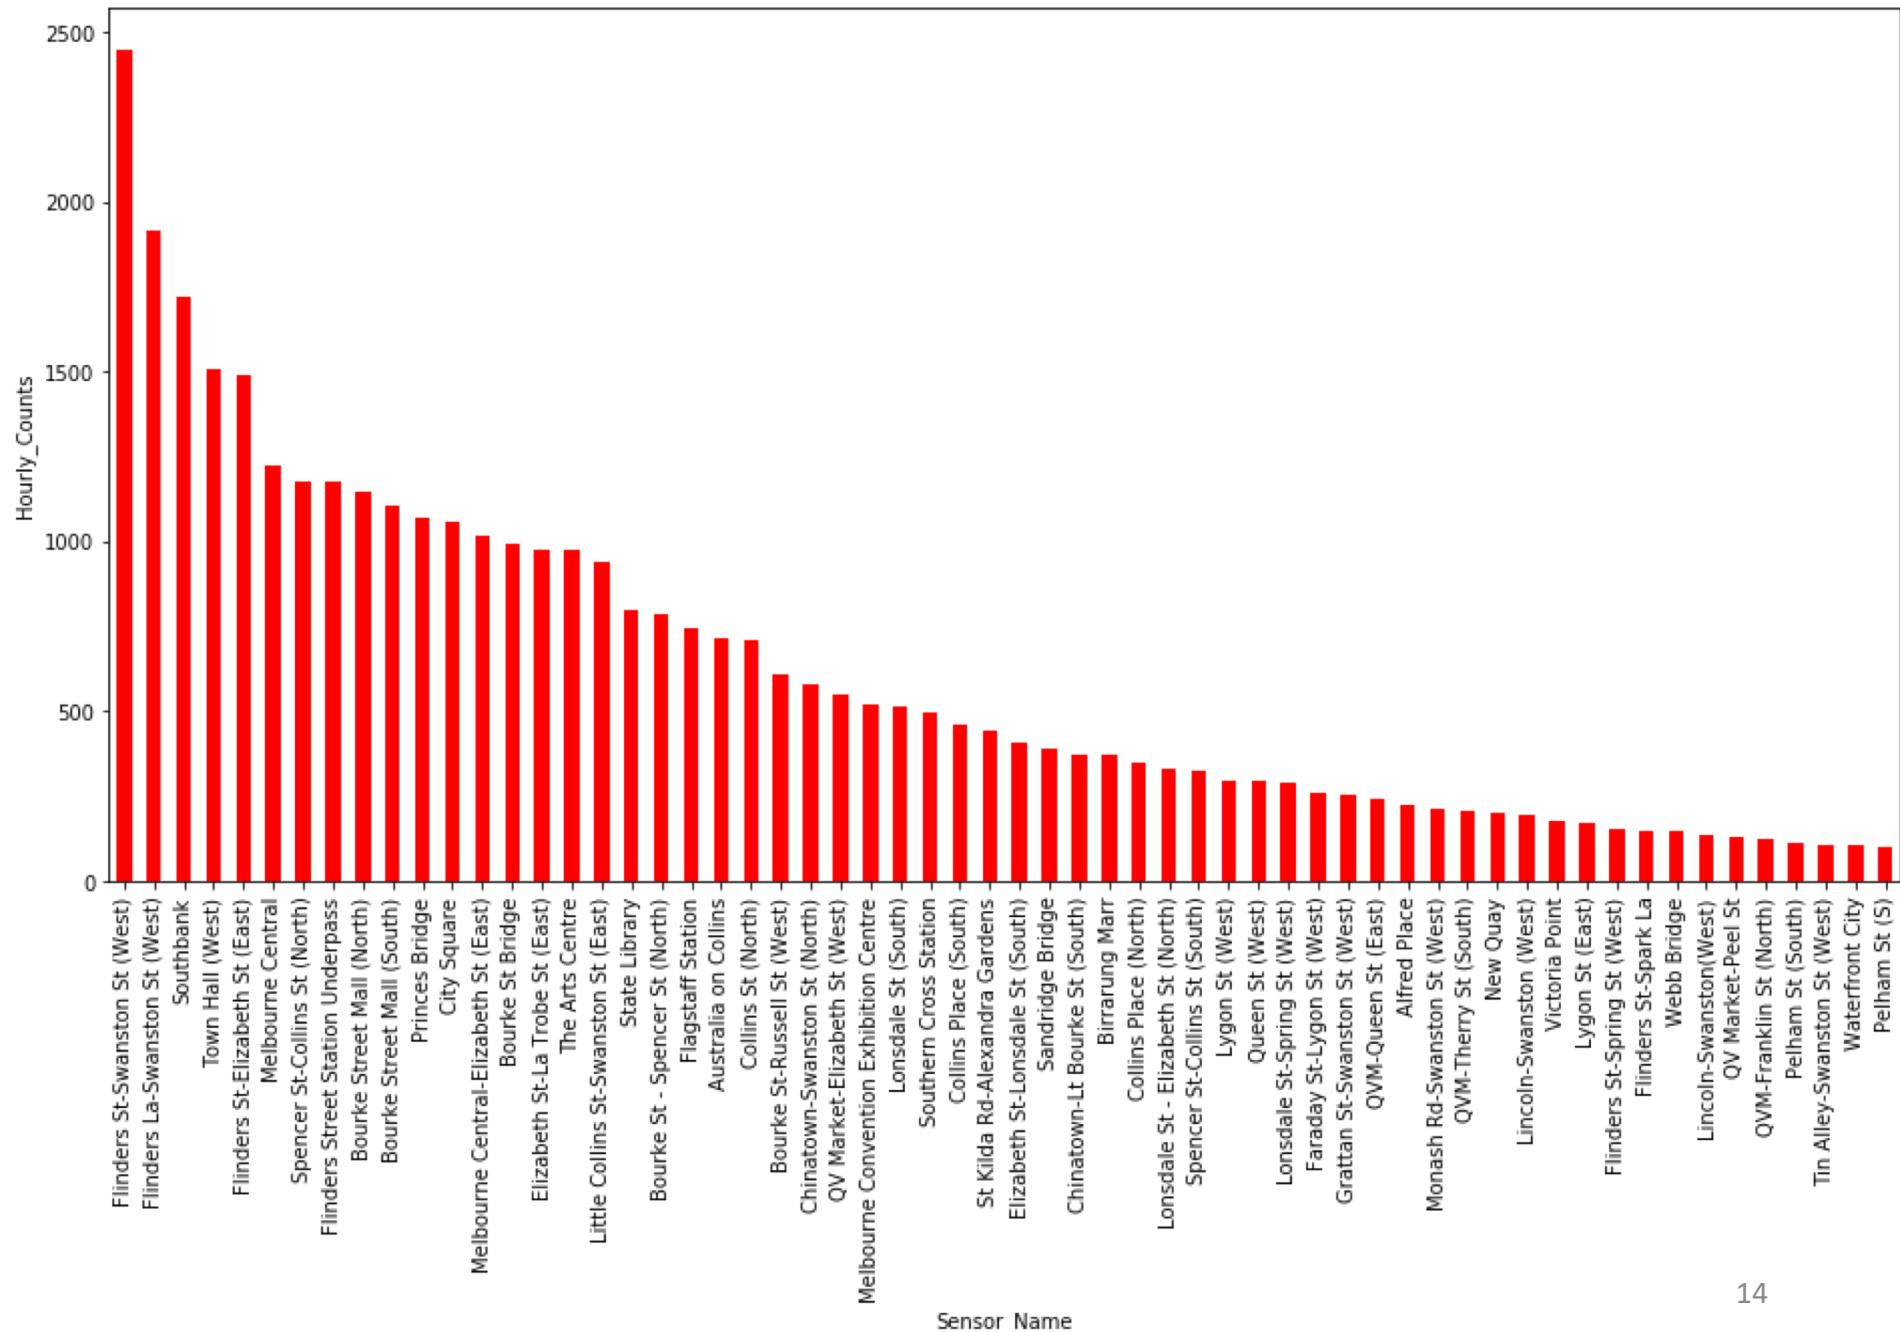

- ❖ Examine Correlations with other data
 - Weather data (Will scrape from wunderground)
 - Restaurant data (Will scrape from yelp or Zomato)
- ❖ Forecasting future predictions and comparing different models such as
 - ARIMA
 - LSTM
 - Investigate whether weekend and weekday trends will require different model
- ❖ More sophisticated analysis and investigation of data such as
 - Reason for large pedestrian count on Saturday night
 - Reason for decrease in accidents in 2018

More data analysis

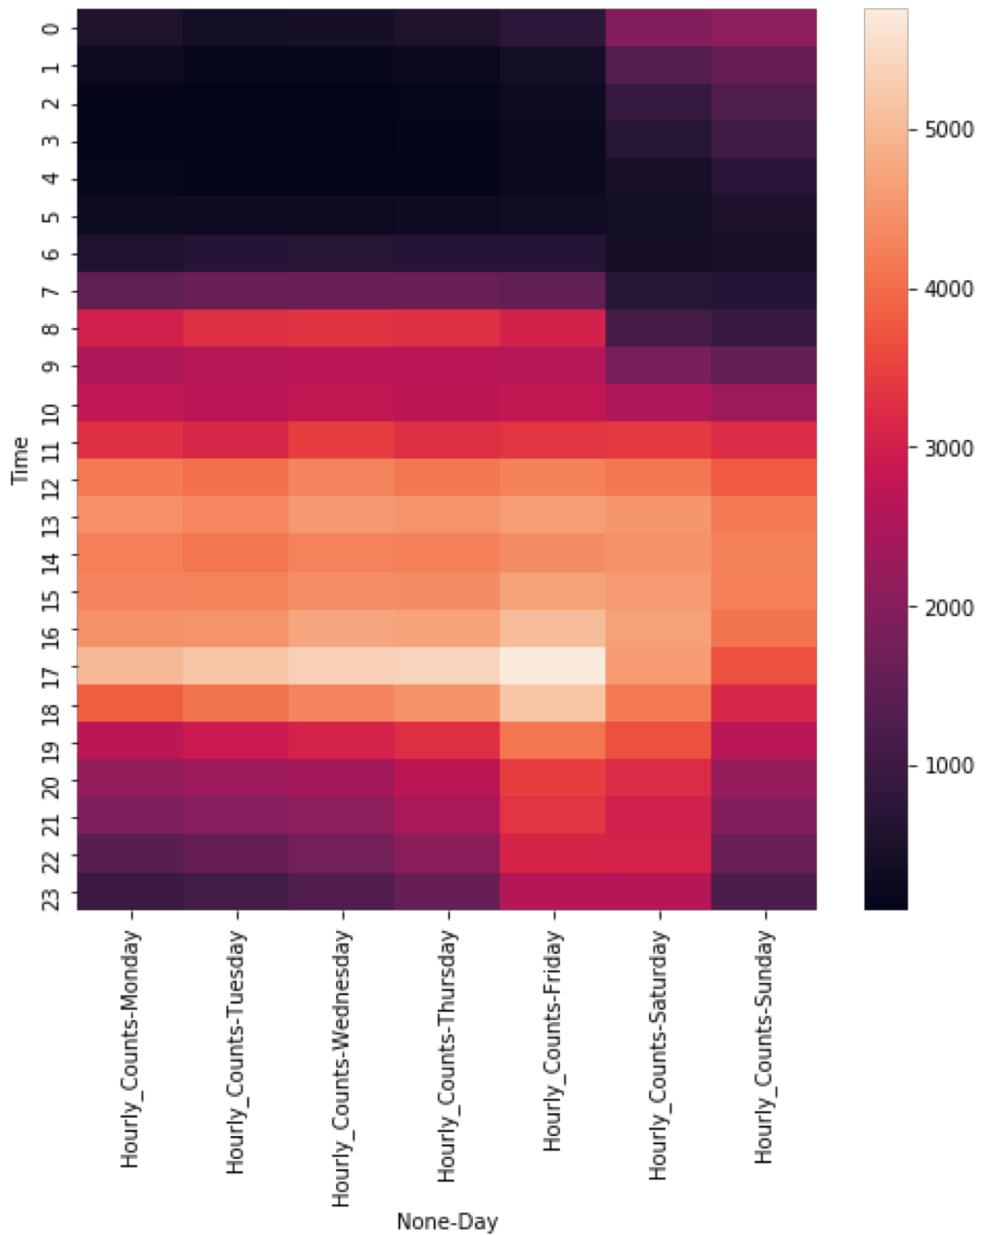

Total pedestrian count for each year

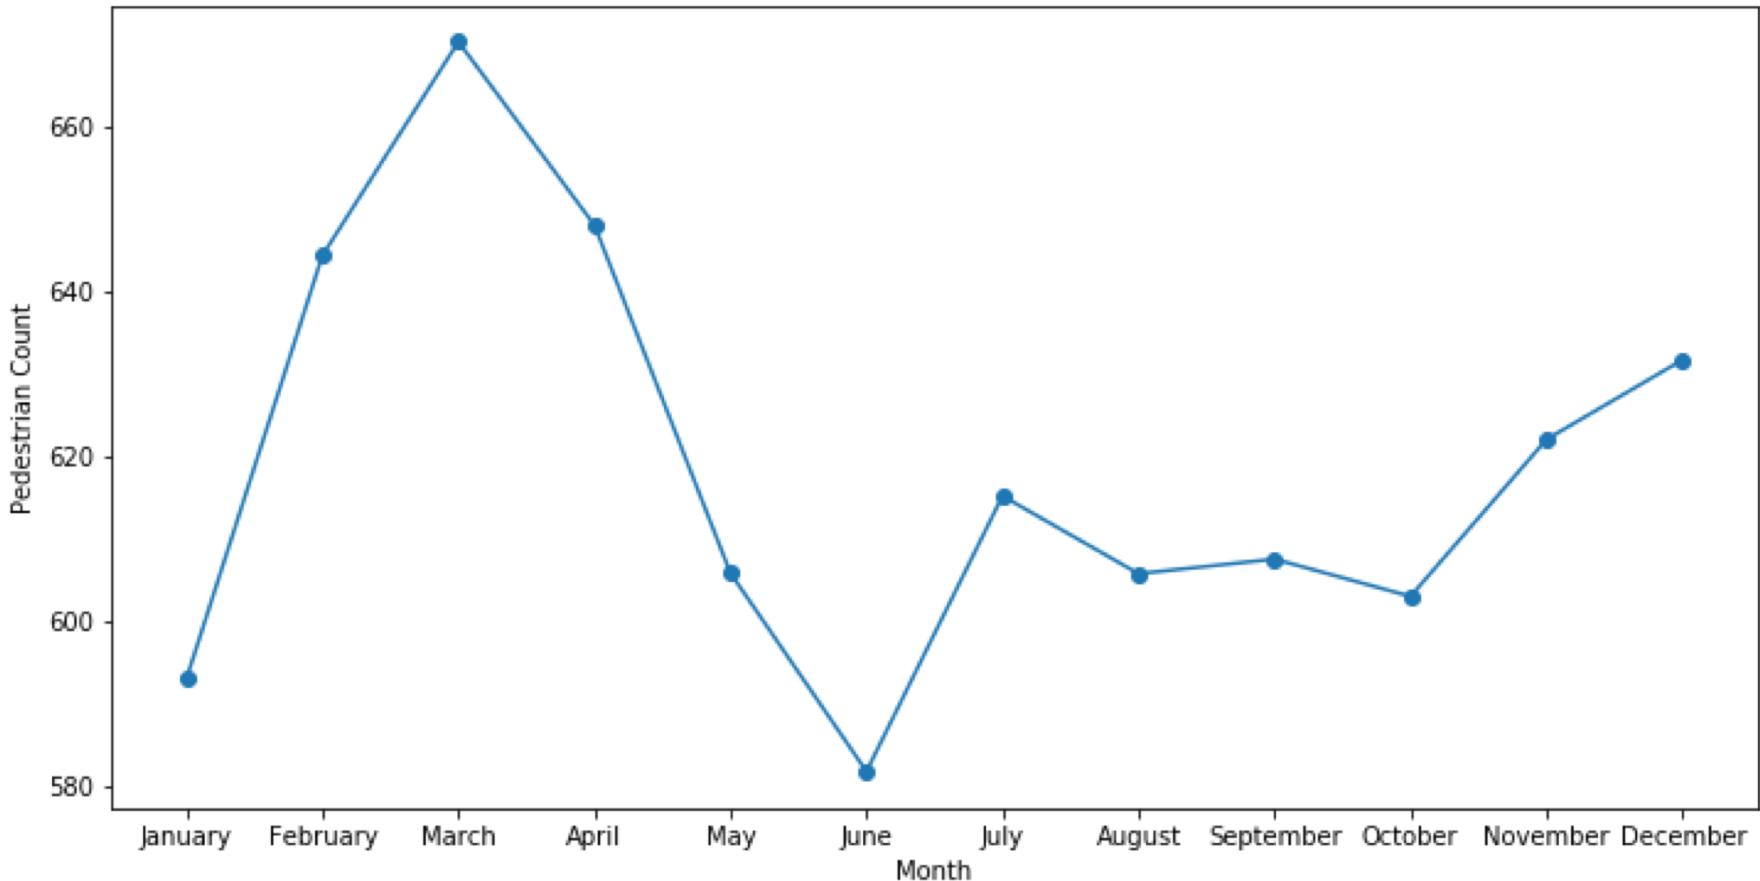

Foot Traffic at different locations in the city

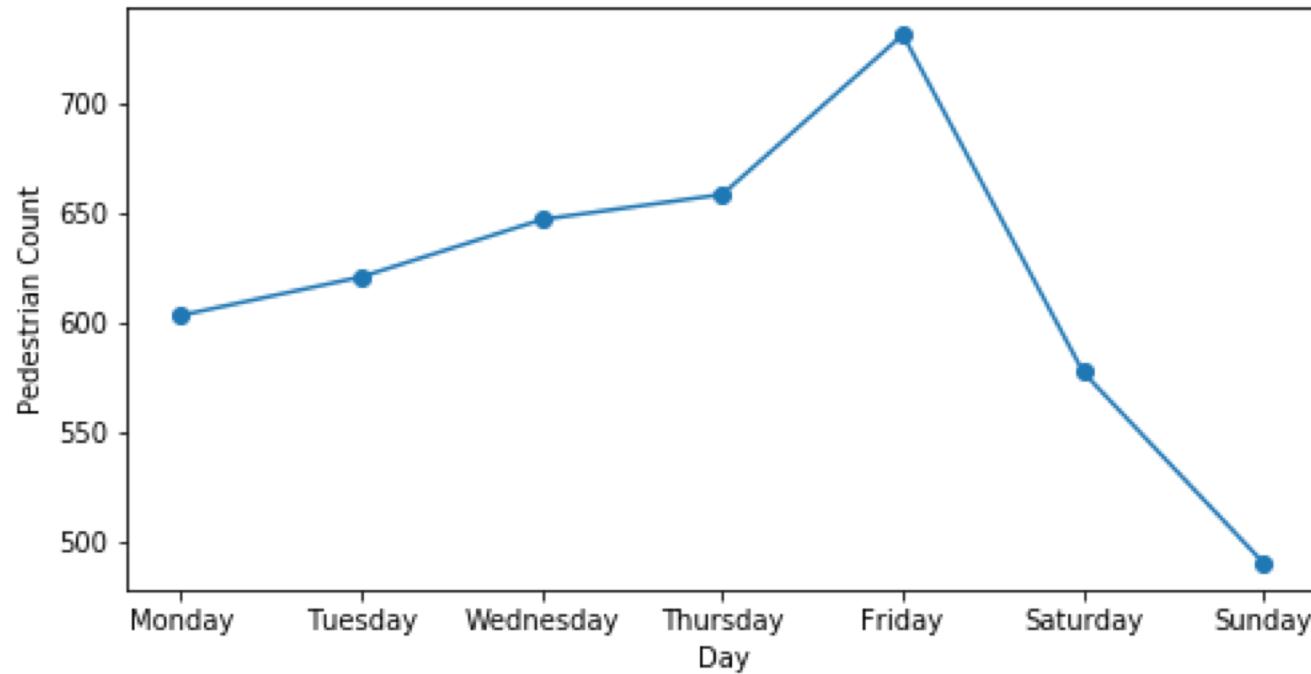

Heat Map for Flinders St-Swanston St (West) Sensor

Mean Hourly Counts grouped by Month

Mean Hourly Counts
grouped by day

Mean Hourly Counts
grouped by
weekend (1) or weekday (0)
